SAS Seminar Nov 25, 2003

Working with SAS Dates

Anna Johansson MEB, Karolinska Institutet

Slides also available on www.pauldickman.com/teaching/sas/index.html

1

Outline

- Formats and Informats
- SAS Date variables
- Converting CHAR and NUM into SAS Dates
- Extracting birthdate from PNR
- SAS Date functions
- Calculating age in exact years
- Calculating age at diagnosis from PNR and diagnosis date
- YEARCUTOFF option for two-digit years

2

Formats and Informats

A format is a layout specification for how a variable should be printed or displayed.

An informat is a specification for how raw data should be read.

SAS contains many internal (pre-defined) formats and informats.

To see a list of all internal formats and informats, type

help formats

in the command line and then click on 'Informats and Formats: Index' in the resulting window.

Examples. Numerical formats

| :xampies. Numei | icui ioriiiuts | |
|-----------------|----------------|------------------|
| Stored Value | Format | Displayed Value |
| 12345.9876 | 10.4 | 12345.9876 |
| 12345.9876 | 10.2 | 12345.99 |
| 12345.9876 | 8.2 | 12345.99 |
| 12345.9876 | COMMA11.4 | 12,345.9876 |
| 12345.9876 | BEST8. | 12345.99 |
| 12345.9876 | BEST4. | 12E3 $(E3=10^3)$ |

Example. Assign formats in DATA or PROC steps

```
data bc.main;
  set bc.cancerreg;
  ... Statements ...;
  format age 4.0
         bmi 4.2
        birthyr best5.;
proc print data=bc.main;
  var birthyr age bmi;
  format age 4.0
        bmi 4.2
        birthyr best5.;
run;
```

| Stored Value | Format | Displayed Value |
|------------------|-------------|-----------------|
| 'Anna Johansson' | \$20. | Anna Johansson |
| 'Anna Johansson' | \$10. | Anna Johan |
| 'Anna Johansson' | \$UPCASE20. | ANNA JOHANSSON |

Informats

An informat is used when you read in data from a file. It specifies how SAS should interpret the values that are read into a new variable

```
data bc.main;
```

run;

Formats are much more widely used in our department then informats, since we usually already have SAS Data sets and do not need to read in data from other data sources.

User-defined formats

User-defined formats and informats can be constructed using PROC FORMAT.

```
proc format;
```

```
value sex 1,3,5,7,9='Male'
0,2,4,6,8='Female';
```

The code above only creates the format, it does not associate it with any variable. Formats can be associated with variables in either data steps or proc steps (see earlier slide) by using the FORMAT statement in a DATA or PROC step.

```
format gender sex.;
```

8

If we do a PROC PRINT on the data using format SEX, then the result is $% \left(1\right) =\left(1\right) \left(1\right) +\left(1\right) \left(1\right) \left(1\right) +\left(1\right) \left(1\right) \left$

Obs Gender

- 1 Male
- 2 Male
- 3 Female
- 4 Male

5 Female

•••

Any calculations made using a variable in a data step will be based on the raw data (i.e. the format is ignored).

When fitting statistical models, however, the model is fitted to the formatted value (i.e. formats can be used for grouping/categorisation).

SAS Dates

From its inception, the SAS System has stored date values as the integer number of days calculated from January 1, 1960.

Leap years, century, and fourth-century adjustments are made automatically. Leap seconds are ignored, and the SAS System does not adjust for daylight saving time.

SAS users can convert external data to or from SAS date values by the use of various informats and functions.

10

Example. Date Formats

3489 is the number of days between 1 Jan 1960 until 21 July 1969.

| Stored Value | Format | Displayed Value |
|--------------|-----------|-----------------|
| 3489 | DATE9. | 21JUL1969 |
| 3489 | DDMMYY8. | 21/07/69 |
| 3489 | YYMMDD6. | 690721 |
| 3489 | YYMMDD8. | 69-07-21 |
| 3489 | YYMMDD10. | 1969-07-21 |
| | | |
| | | 11 |

Reading raw data into SAS Date variables

Raw data can be read into SAS date variables using the appropriate informat. $\,$

```
data bcdates;
```

```
input date yymmdd6.;
cards;
310317
```

681224 651128; run;

Obs date

2 3280 3 2158

```
If you want to be able to understand printouts of these dates, it is necessary to assign an appropriate format to the variable DATE.

In a data step (stored permanently to the variable):

data bcdates;
   input date yymmdd6.;
   format date yymmdd6.;
   cards;
310317
681224
651128;
run;
```

```
In a proc step (stored during the PROC only):

proc print data=bcdates;
  var date;
  format date yymmdd6.;
run;

To print a variable without an assigned permanent format:

proc print data=bcdates;
  var date;
  format date ;
run;

Note: there has to be a space before the ";" in the format statement to remove the format.
```

```
Without format:

Obs date
1 -10517
2 3280
3 2158

With format yymmdd6.

Obs date
1 310317
2 681224
3 651128
```

```
Converting a CHAR variable into a SAS Date variable

This can be done using the INPUT function.

The following code converts a CHAR variable (birthdate_char) into a SAS Date variable (birthdate).

birthdate = INPUT(birthdate_char, yymmmdd6.);

Note that yymmdd6. is an informat in this statement.
```

```
Print without format:
birthdate_char
                    birthdate
′310317′
                    -10517
′ 681224′
                       3280
'651128'
                      2158
Print with format (YYMMDD10.):
birthdate_char
                     birthdate
                    1931-03-17
′310317′
'681224'
                    1968-12-24
'651128'
                    1965-11-28
                                                         17
```

```
Extracting the birthdate from PNR

The following code extracts date of birth from PNR (CHAR variable) and writes it out as a SAS date variable.

birthdate = INPUT(SUBSTR(pnr,1,6), yymmdd6.);

The substr function (substring) reads 6 positions starting from the first position of variable PNR.

Note that yymmdd6. is an informat.

PNR birthdate
'310317-0367' -10517
'681224-0873' 3280
'651128-2766' 2158
```

Converting a NUM variable into a SAS Date variable

To convert a numerical variable into a SAS Date variable, you must first convert the NUM into a CHAR, and then convert the CHAR into a DATE.

The PUT function converts any type of variable into a CHAR variable.

birthdate_char = PUT(birthdate_num, 6.0);

birthdate = INPUT(birthdate_char, yymmdd6.);

Note that the 6.0 in the PUT function is a format, it describes the variable we read from.

Note that $\ensuremath{\mathsf{yymmdd6}}.$ in the INPUT function is an informat.

19

| birthdate_num | birthdate_char | birthdate | |
|---------------|--------------------|-----------|----|
| 310317 | ′310317′ | -10517 | |
| 681224 | ' 68122 4 ' | 3280 | |
| 651128 | ' 651128' | 2158 | |
| | | | |
| | | | |
| | | | |

SAS Date Functions

Why do we want to use SAS Dates?
Why can't we use CHAR and NUM variables for dates?

Dates are special numerical values, we want to make complicated calculatations on them, such as differences between dates (age, duration).

With SAS Date functions we can take into account leap years, the differences in the lengths of months, etc.

21

Ex. Calculating difference in years between two SAS Dates

duration = YRDIF(startdate,enddate,'actual');

Print without format:

startdate enddate duration 3489 16034 34.3479

Print with formatted dates:

startdate enddate duration 1969-07-21 2003-11-25 34.3479

22

Ex. Converting separate year, month, day NUM variables into a SAS Date

If the values of year, month and day are stored in separate NUM variables, these can be written to a single SAS date variable using the MDY function:

birthdate = MDY(month, day, year);

Print without format:

year month day birthdate 1969 7 21 3489

Print with format yymmdd10. for birthdate:

year month day birthdate
1969 7 21 1969-07-21

23

Date Functions in SAS

DATDIF(sdate,edate,'actual') returns the number of days

between two dates

DATE() returns the current date as a

SAS date value

DAY(date) returns the day of the month

from a SAS date value

MDY(month,day,year) returns a SAS date value from

month, day, and year NUM values

MONTH(date) returns the month from a SAS

date value

TIME() returns the current time of day

YEAR(date) returns the year from a SAS date

value

YRDIF(sdate,edate,basis) returns the difference in years

between two SAS dates

The *basis* in the YRDIF function determines what number of days SAS should use for each month and year. The *basis* can have any of the four values:

30/360 = 30 days each month, 360 days each year - Alias '360' ACT/ACT = Actual days each month, Actual days each year

- Alias 'ACTUAL'

ACT/360 = Actual days each month, 360 day each year - No Alias

ACT/365 = Actual days each month, 365 day each year - No Alias

25

To see a list of in-built SAS date functions write

'help functions'

in the command line and go to

'Functions: Index'

and from there to

'SAS Date and Time Functions'.

26

Example. Date Functions

| Function | Stored value X | With date format DATE. |
|---------------------------------|----------------|------------------------|
| X=date(); | 16034 | 25NOV2003 |
| X=mdy(11,25,2003); | 16034 | 25NOV2003 |
| X=day(3489); | 21 | - |
| X=month(3489); | 7 | - |
| X=year(3489); | 1969 | - |
| X=yrdif(3489, 16034, 'actual'); | 34.3479 | - |

7

Calculating AGE in exact years

To calculate exact age, i.e. age that takes leap years into account, we simply use the YRDIF function for SAS Dates.

We combine it with the INT function, which returns the integer part of the result from the YRDIF function. $\label{eq:combine} % \begin{center} \begin{cen$

age = INT(YRDIF(birthdate, enddate, 'actual'));

Print with formatted dates:

birthdate enddate age 1969-07-21 2003-11-25 34

28

Calculating AGE in exact years, alternative method SAS version 6

This SAS code was written by Billy Kreuter, who posted it to the SAS-L mailing list several years ago. Billy authored an article in SAS Communications (4th quarter 1998) which discusses this issue in greater detail.

The following code calculates age in completed years from the variables $\it birth$ and $\it some date.$

The approach is to first calculate the number of completed months between the two dates and then divide by 12 and round down to get the number of completed years.

29

The following code could be used to calculate the number of completed months between the dates birth and somedate.

The first part of the code uses the intck function to calculate the number of times a 'month boundary' (e.g from January to February) is crossed between the two dates. Crossing a 'month boundary' does not necessarily mean that a completed month has elapsed so a correction needs to be made when the end date (somedate) is less than the start date (birth).

To convert completed months to completed years one uses years = FLOOR(months/12);

The floor function simply rounds a real number down to the nearest integer, for example floor(4.93)=4.

Calculate age at diagnosis from PNR and diagnosis date

It is often necessary to calculate age at diagnosis from variables representing the personal identification number and the date of diagnosis (stored as a character variable).

The first step is to create SAS date variables representing the birth date and diagnosis date.

- The date of diagnosis is stored in CHAR variable DXDAT, which is converted to a SAS date variable called DIAGDATE using the INPUT function.
- Construct the SAS date variable called BIRTHDATE by first extracting the date from the PNR using the SUBSTR function.

31

35

• Age at diagnosis is calculated as the number of completed years between the two dates.

The raw data file rawdata.sas7bdat contains two observations only:

```
pnr dxdat
196511289999 990622
193404199999 590420
```

32

```
data bcdiag;
    set rawdata;

/* convert the character variable to a SAS date var */
    diagdate = INFUT(dxdat, yymmdd6.);

/* extract the birthdate from FNR */
    birthdate = INFUT(SUBSTR(pnr,1,8), yymmdd8.);

/* calculate AGE at diagnosis */
    agediag = INT(YRDIF(birthdate, diagdate, 'actual'));

format diagdate yymmdd10.
    birthdate yymmdd10.;
run;
```

```
Print the result:

proc print data=bcdiag;
  title 'Calculating age at diagnosis';
  var pnr dxdat birthdate diagdate agediag;
  format birthdate diagdate; * to get without format;
  run;
```

Without the format on birthdate and diagdate:

| PNR | DXDAT | BIRTHDATE | DIAGDATE | AGEDIA |
|--------------|--------|-----------|----------|--------|
| 196511289999 | 990622 | 2158 | 14417 | 33 |
| 193404199999 | 590420 | -9388 | -256 | 25 |

With format YYMMDD10. on birthdate and diagdate:

| PNR | DXDAT | BIRTHDATE | DIAGDATE | AGEDIAG |
|------------------------------|-------|-----------|----------|---------|
| 196511289999 193404199999 | | | | |

Two-digit years, YEARCUTOFF=option

SAS date informats, formats, and functions all accept two-digit years as well as four-digit years.

If the dates in your external data sources contain four-digit years, then the SAS System will accept and display those four-digit years without any difficulty as long as you choose the appropriate informat and format (YYMMDD10.).

If dates in your external data sources or SAS program statements contain two-digit years, you can specify the century prefix assigned to them by using the YEARCUTOFF= system ontion

The YEARCUTOFF= option specifies the first year of the 100-year span that is used to determine the century of a two-digit year.

If the YEARCUTOFF is set to 1900 then that implies that all twodigit years are assumed to be in the 1900's.

If you are working with a study where the last date of follow-up is 1992, but some individuals in your study were born in the late 1800's, you may wish to set the YEARCUTOFF option to 1893.

This would lead to SAS interpreting values for year between 93 and 99 as being in the 1800's.

| YEARCUTOFF= | Interpretation of years 00-99: | |
|-------------|--------------------------------|----|
| 1900 | 00-99 ↔ 1900-1999 | |
| | | |
| 1893 | 93-99 ↔ 1893-1899 | |
| | 00-92 ↔ 1900-1992 | |
| | | |
| 1920 | 20-99 ↔ 1920-1999 | |
| | 00-19 ↔ 2000-2019 | 37 |
| | | |

```
By default
```

```
YEARCUTOFF = 1900 in Version 6
YEARCUTOFF = 1920 in Version 8
```

To change the default YEARCUTOFF value use the global statement (written outside DATA steps or PROC steps) OPTIONS.

```
options yearcutoff = 1893;
```

38

Let's consider an example of reading in dates with both two-digit and four-digit years. Note that in this example the YEARCUTOFF= option has been set to 1920.

```
options yearcutoff=1920;
```

```
data schedule;
```

```
input @1 rawdata
                 $8.
    @1 date
                 yymmdd8.;
```

format date yymmdd10.;

651128

18230314

131225

cards;

19651128

19131225

run:

651128 1965-11-28 19651128 2 1965-11-28

18230314 1823-03-14

19131225 1913-12-25 131225 2013-12-25

Note that the dates in observations 1 and 2 are the same (a two digit date of 65 defaults to 1965).

But the dates in observations 4 and 5 are different (a two-digit date of 13 defaults to 2013).

Note: variable DATE has been given format yymmdd10.

Dates in the Data Standard at MEB

MEB's Data Standard includes standards for date variables.

Standardised names, values, missing data and formats for date variables are given (these general standards apply to all software including SAS).

Table 2. Standard for date variables

| Variable | Variable | Type | Format/ Value |
|----------|----------------|-----------|---------------|
| | description | | description |
| date | Date | Date/Char | YYYY-MM-DD |
| yr | Year | Date/Char | YYYY |
| mon | Month | Date/Char | MM |
| day | Day | Date/Char | DD |
| yrmon | Year and month | Date/Char | YYYY-MM |

41

From Data Standard at MEB

7. Error codes for dates

When dates are partly missing or incorrect (i.e. 2001-02-30) there is a need for corrections or imputations. The corrections should be done in a new derived variable (e.g. new variable XDIAGDATE may be derived from the raw data variable DIAGDATE).

Together with the new derived variable, information about the errors should be documented with error codes describing the problem and the solution (i.e. error id, description and solution), see Table 6. One example of the usage is shown in Table 7.

| XERROR II | | | • |
|-----------|---------------------------------|-------------------------|---|
| | | XSOLUTION | |
| | 0 Valid date | None | |
| | 1 Day missing/stated 00 | Day set to 15 | |
| | 2 Month and day | Month and day set to | |
| | missing/stated 00 | 0701 | |
| | 3 Last day of month not correct | Day set to last correct | |
| | 4 Incorrect date | Set value to null | |
| | | (empty) | |
| | | | |

| Table 7. | Example of | of the use of err | or codes in the d | atabase | |
|----------|------------|-------------------|-------------------|---------|--|
| PATNR | DIAGDATE | XERROR_ID | XDIAGDATE | | |
| 1 | 1997-03-25 | 0 | 1997-03-25 | | |
| 2 | 1995-07 | 1 | 1995-07-15 | | |
| 3 | 1969 | 2 | 1969-07-01 | | |
| 4 | 2003-02-30 | 3 | 2003-02-28 | | |
| 5 | 5344-23-69 | 4 | | | |
| | | | | | |
| | | | | | |
| | | | | | |
